## Change based Requirements Management and Cross Domain Traceability with agosense.fidelia

### Change Based Requirements Management

Requirements Management has long ceased to be an independent discipline in the product development process. Requirements are reused and changed whereas changes have to be planned and made reproducible. This is exactly where our requirements management platform agosense.fidelia comes in. When editing request documents, every change is automatically recorded meticulously and can be assigned to a task or a change request. This makes planned changes reproducible at any time. In addition, the effects and necessary changes to other dependent artifacts can be detected even before the documents are edited.

### Cross Domain Traceability

Creating, managing and displaying traces and dependencies is an important task of agosense.fidelia - and it is therefore the data warehouse or central information platform for all relevant development data. The platform makes it easy to create and maintain relationships between all artifacts via drag & drop. The linked information, such as Requirements, Test Cases, UML Models, etc. are visible to all people involved in a single interface at a glance. Data can be sourced from virtually any popular ALM tool, allowing agosense.fidelia to create and display traceability information across all domains throughout the development process.

*„agosense.fidelia is not only characterized by extremely low license costs, but also guarantees the lowest costs for maintenance and operation due to its modern server and database architecture.“*

### Ease of Use

A primary goal in the design of agosense.fidelia is the consideration of users in their daily work. The operation of agosense.fidelia is intuitive and based on common office products.

### Seamless Integration into your Tool Environment

Integration into the existing tool environment is an important aspect of today's requirements management. agosense.fidelia has all the possibilities to seamlessly integrate into your tool chain and to exchange requirement documents with your business partners.

### **Better Overview & Identification of Impacts**

The unique options such as Split Screen or Trace Columns allow a clear working environment. The impact analysis helps to understand dependencies and thus to identify in advance the risks and effects of changes.

### **Coordinate Team work & improve Quality**

Collaboration on documents, the automatic recording of all changes and integrated approval processes simplify work in teams and permanently improve product quality through optimal traceability of all processes.

## **These outstanding features support your professional Requirements Management:**

### **Integrated Change Management**

Each editing step is automatically recorded down to the smallest detail and can be reproduced at any time.

### **Impact Warnings**

Artifact changes automatically generate a warning to linked artifacts, including traceability to the origin.

### **Trace Columns**

As an extension to the usual traceability matrices, we have developed the Trace Columns. All trace informations are visible and filterable directly in the document view.

### **Reviews & Releases**

Based on the recorded changes, agosense.fidelia supports the execution of dedicated reviews and approval processes for new or changed requirements.

### **Document and Solution Templates**

Document templates and complete solution templates can be provided centrally to specify attributes, workflow and dependency rules, or even document design.

### **Document Generation, Export and Import Functions**

agosense.fidelia supports import and export for a variety of file formats, such as: HTML, PDF, MS Office, OpenOffice, ReqIF, etc.

### **And much more ...**

Configuration Management - dashboards, reports, metrics - extensive filter and search options - user-specific views - drag & drop for file attachments, images, etc.

### **Best Performance & high Availability**

Fast response times for large amounts of data greatly improve usability and user acceptance. Modern architecture makes agosense.fidelia the most efficient and performant solution on the market.

### **Comply with regulatory Requirements**

The unique capabilities for creation and visualization of traces provide the best prerequisites for meeting regulated industry requirements. Solution templates for example for ISO 26262 help with a quick implementation.

### **Real-Time Collaboration**

Documents can be edited simultaneously by multiple users - including conflict protection. Changes are immediately visible to everybody for a perfect cooperation.

### **Split Screen**

In the Split Screen documents and artifacts are displayed side by side and can be linked via drag & drop.

### **Intuitive Editing & Navigation**

agosense.fidelia combines the structured capturing of requirements with the ease of use of familiar Microsoft Office products.

### **Baselines, Branching & Merging**

For parallel development, baselines and branches or variants of requirement documents can be generated and then merged back with just a few mouse clicks.

### **Versioned Traces**

Links and traces are versioned and stored auditable within the baselines.

### **Extensibility Through Plug-in Architecture**

agosense.fidelia includes an extensive plugin architecture for specific functions and processes that go beyond the standard scope.
